5035. Some problems in preventive testing of transformers. S. SŁOWIKOWSKI AND S. ZAGRZEWSKI. *Przegląd elektrotech.*, 31, No. 2-3, 219-26 (1955) In Polish.

Field tests indicated that direct application of Soviet standards for testing of transformer insulation would result in too many withdrawals from operation for maintenance. Data obtained include ratios of insulation resistance 15 sec (R_{15}) and 60 sec (R_{60}) from time of application of voltage (ratio varies with the state of insulation, temperature and applied voltage), magnitude of R_{60}, ratio of capacitance at 2 c/s (C_2) and 50 c/s (C_{50}), capacitance current and tan δ. A diagram of a circuit for measurement of C_2/C_{50} is shown in detail. Acceptable magnitudes of these insulation characteristics, which would allow satisfactory operation of the power system, are discussed.

Słowikowski, W. Note on the general theory of closed continuous mappings of bicompact T_1 spaces. Bull. Acad. Polon. Sci. Cl. III. 3 (1955), 421–424.

"In this paper, I wish to present an algebraic point of 1 – F/W view on the theory of closed continuous mappings of bicompact T_1-spaces. In this way I obtain the natural characterisation of the family of inverse images of an arbitrary closed continuous mapping of bicompact T_1-spaces. This result may be applied to the theory of semi-continuous decompositions of bicompact T_1-spaces." (Author's summary.)

M. Henriksen (Lafayette, Ind.).

Słowikowski, W.

Słowikowski, W.; and Zawadowski, W. A generalization of maximal ideals method of Stone and Gelfand. Fund. Math. 42 (1955), 215–231.

A semiring [Vandiver, Bull. Amer. Math. Soc. 40 (1934), 914–920] is a non-void set $\mathfrak{A}$ with two binary associative operations, $+$ and $\cdot$, for which the left and right distributive laws hold. It is assumed throughout this paper that both $+$ and $\cdot$ are commutative, that there is a zero 0 ($0+x=x$ for all x) and an identity 1 ($1 \cdot x=x$ for all x), and that $0 \neq 1$. An ideal of $\mathfrak{A}$ is a non-void proper subset I of $\mathfrak{A}$ such that $a+b \in I$ if $a, b \in I$ and $ax \in I$ if $a \in I$ and $x \in \mathfrak{A}$. $\mathfrak{A}$ is called a positive semiring if $(1+x)^{-1}$ exists for all $x \in \mathfrak{A}$. Let $\mathfrak{M}$ be the set of all maximal ideals of $\mathfrak{A}$. Let Ω be the set $\{x : x \in \mathfrak{A}, x^{-1}$ exists$\}$. For a positive semiring $\mathfrak{A}$, the radical Rad $\mathfrak{A}$ is defined as $\cap \{M : M \in \mathfrak{M}\}$.

A number of simple facts about semirings are first proved. The following are a fair sample. Theorem 4. $\mathfrak{A}$ is positive if and only if $x+y \in M$ implies $x, y \in M$ for all $M \in \mathfrak{M}$. Theorem 5. Let A be a positive semiring. Then Rad $A = \{0\}$ if and only if for every $x \neq 0$, there is $y \in \mathfrak{A}$ such that $x+y \in \Omega$. Theorem 8. Let $\mathfrak{A}$ be positive. The following conditions are equivalent. (a) For $M, N \in \mathfrak{M}$ and $M \neq N$ there exist x, y such that $xy \in$ Rad $\mathfrak{A}$, $x \notin M$, and $u \notin N$. (b) For every $M \in \mathfrak{M}$ and $x \notin M$, there are a, b such

Slowkowski, W.; Zawadowski, W.

3

that $ab \in$ Rad $\mathfrak{A}$, $b \notin M$, and $x+a \in \Omega$. (c) If $x+y \in \Omega$, then there are $u, v \in \mathfrak{A}$ such that $uv \in$ Rad $\mathfrak{A}$ and $(x+u)$, $(u+v) \in \Omega$.

The authors next topologize $\mathfrak{R}$ by the method of M. H. Stone [Trans. Amer. Math. Soc. 40 (1936), 37–111]. [See also Gel'fand and Šilov, Mat. Sb. N.S. 9(51) (1941), 25–39; MR 3, 52; and Jacobson, Proc. Nat. Acad. Sci. U.S.A. 31 (1945), 333–338; MR 7, 110.] A sub-basis for open sets in $\mathfrak{R}$ are the sets $\Gamma_x = \{M : M \in \mathfrak{R}, x \notin M\}$, for all $x \in \mathfrak{A}$. It is easy to show that $\mathfrak{R}$ is a compact T_1-space with this Γ-topology. Theorem 14. Let $\mathfrak{A}$ be positive and suppose that if $x, y \in A$ and $x \neq y$, there is an $M \in \mathfrak{R}$ such that exactly one of x, y is in M. Then $\mathfrak{A}$ is isomorphic with a semiring of sets ($\cup$ and $\cap$ correspond to $+$ and $\cdot$) forming an open basis for the compact T_1-space $\mathfrak{R}$. Theorem 17. Let $\mathfrak{L}$ be a distributive lattice with 0 and 1 such that for all $x, y \in \mathfrak{L}$ with $x+y=1$, there are $u, v \in \mathfrak{L}$ for which the equalities $uv=0$, $u+x=1$, $v+x=1$ hold. Then $\mathfrak{L}$ is isomorphic with an open basis of sets for some compact Hausdorff space. As applications, the authors prove the known theorems that a compact Hausdorff space X is determined by its lattice of open sets and also by the semiring of non-negative continuous real-valued functions on X.

It would be interesting to know the relation between the radical Rad $\mathfrak{A}$ and the Jacobson radical for A introduced by Bourne [ibid. 37 (1951), 163–170; MR 13, 7].

Słowikowski, W. Note on the application of the Pauli ring to form the metric tensor in the general theory of relativity. Bull. Acad. Polon. Sci. Cl. III. 4 (1956), 313–320.

Spin-tensors (called in the paper P-tensors) are considered as elements of the Pauli ring. An anholonomic coordinate system is used to introduce a metric tensor, a non-symmetric connexion and an "invariant" derivative. (This derivative is rather meaningless, being non-covariant. The author's formalism differs only in notation from that used in the spinor calculus.) A. Trautman.

SŁOWIKOWSKI, W.

Słowikowski, W. A generalisation of Mikusiński's operational calculus. Bull. Acad. Polon. Sci. Cl. III. 4 (1956), 643–647.

The author seeks a solution for the differential system

$$x^n(t) + A_1 x^{n-1}(t) + \cdots + A_n x(t) = a(t) \ (-\infty < t < \infty),$$

$$x^j(0) = x_j \ (j = 0, 1, \cdots, n-1).$$

Here X_0 is a linear topological space, locally convex and sequentially complete; X is the space of functions $y(t)$ which are continuous in t and valued in X_0; the A_i are given linear continuous endomorphisms of X_0; the x_j are given elements in X_0; the $a(t)$ is an element (given) in X and the solution $x = x(t)$ is required to be in X.

The classical method of successive approximations could be applied here to show that there is one and only one solution. However the author seeks to express the solution by means of an algebraic formula, using appropriate inversion operators. For this purpose he lets S denote the operator on X: $Sx = y$ means $x(t) = \int_0^t y(\tau)d\tau$. Then X is imbedded in a space H so that S can be ex-

Slowikowski. W.

tended to an automorphism of Ω [this employs a completion process described by the author in same Bull. 3 (1955), 3–6; MR 17, 63]. Then the author assumes that the polynomial $\xi^n + A_1\xi^{n-1} + \cdots + A_a$ can be suitably factored as $(\xi - B_1)^{n_1}(\xi - B_2)^{n_2} \cdots (\xi - B_k)^{n_k}$; with this assumption, he obtains an algebraic expression, using inverses of operators $S - B_r$, to express the solution of the given differential system.   *I. Halperin.*

SLOWIKOWSKIY, W.

Slowikowski, W. A topologisation of the conjugate space of a locally convex linear space. Bull. Acad. Polon. Sci. Cl. III. 5 (1957), 113–115, XI. (Russian summary)

Let X' denote the conjugate space of a locally convex linear topological space X. Examples are known where X' is an F-space but is not a t-space (espace tonnelé), and is not bornological in the strong topology [J. A. Dieudonné, Bull. Amer. Math. Soc. 59 (1953), 495–512; MR 15, 963]. The author introduces a new topology for X', in terms of which he obtains several new results, including the following. He shows that X' becomes bornological and is a t-space. Moreover, if X is bornological it can be isomorphically imbedded in X''. The new topology is defined as follows. First, a family $\mathscr{R}$ of subsets of X will be called bounded if for every neighborhood U of the origin there is a real number $\lambda > 0$ and an element $A \in \mathscr{R}$ such that $\lambda A \subset U$. Now consider the bounded families $\mathscr{R}$ of non-empty, symmetric, convex subsets of X which contain with each pair A, B an element $C \subset A \cap B$. For each such $\mathscr{R}$, define the pseudo-norm $|x'|_{\mathscr{R}} = \inf_{A \in \mathscr{R}} (\sup_{x \in A} x'(x))$. The author's topology is that which is induced in X' by these pseudo-norms.   D. H. Hyers (Los Angeles, Calif.).

Slowikowski, W. On a certain variation problem in P-geometry and its relations to physical problems. Bull. Acad. Polon. Sci. Cl. III. 5 (1957), 385–386, XXXI. (Russian summary)

This is a continuation of a paper by the same author on applications of the Pauli ring [same Bull. 4 (1956), 313–320; MR 18, 447]. Equations similar to those of Dirac and Proca are derived from a variational principle.

A. Trautman (Warsaw).

Slowikowski, W. On a certain subclass of (DF) linear locally convex spaces. Bull. Acad. Polon. Sci. Cl. III. 5 (1957), 387–388, XXXI. (Russian summary)

The author defines a DB_0 space X as a linear locally-convex bornological space for which there is a sequence of Banach spaces $\{X_n\}$ each of which can be mapped linearly into X with no kernel and such that if B is a bounded subset of X then B is bounded in at least one X_n. The author has given a definition of strongest dual of a locally convex linear topological space (l.t.s.) [same Bull. 5 (1957), 113–115; MR 19, 154] and he asserts the strongest dual of a metrizable locally convex l.t.s. is a DB_0 space. The DB_0 spaces satisfy property P defined in the review below.   D. G. Bourgin (Paris).

Słowikówski, W. (hF)-spaces and the Banach inversion property. Bull. Acad. Polon. Sci. Cl. III. 5 (1957), 487–489, XLI. (Russian summary)

A class K of real linear spaces has the Banach inversion property, P, if for every pair X, $Y \in K$ and every 1-1 linear transformation h of X onto Y, h^{-1} is continuous. A linear space, X, is an hF space if it is the union of a fixed ascending sequence of F spaces (X_m) each with an F norm metric $\|\cdot\|_m$ (i.e., norm except for positive homogeneity), where $\|(x_n|X_m)\|_m \to 0$, $n \to \infty$, implies $\|(x_n|X_m)\|_{m+1} \to 0$. The topology of X induced by $(X_n, \|\cdot\|_n)$ is termed the hF topology. The convergence notions are introduced in the usual way: $(x_n) \subset X$ is h-convergent to x_0, i.e., $x_n \xrightarrow{h} x_0$, if for some m, $(x_n) \cup (x_0) \subset X_m$ and $\|x_n - x_0\|_m \to 0$. Also $x_n \xrightarrow{h^*} x_0$ if for an arbitrary subsequence (x_n') and for some $(x_{n_i}') \subset (x_n')$, $x_{n_i}' \xrightarrow{h} x_0$; so h- or h^*-continuity of a distributive operation, $U: X \to Y$ is clear. The author asserts h-, h^*-continuity and the closure of the graph of U are all equivalent and that the hF spaces satisfy P. Extension is made to locally convex hF spaces, i.e., hF spaces admitting a bornological locally convex topology compatible in a natural way with the hF topology. *D. G. Bourgin.*

Orig Pub : Przegl. lekar., 1955, 11, No 5, 152-155

Abstract : A giant tumor of the abdominal cavity is described which
           weighed 34.4 kg. Histologically it proved to be a pseudomucin-
           ous cystadenoma which most likely had originated from the
           ovary. The postoperative course was uneventful and the
           patient was discharged after 3 weeks. -- V.I. Yanishevskiy.

reasons of the decrease in formation of labile P.
during incubation of the pulp of deefferentiated
muscles. Another reason is the disturbed synthesis
of ATP. Changes in muscle metabolism noted after
section of the common trunk of the sciatic nerve
are produced mainly by the absence of trophic effects
from the motor innervation.

muscles symmetrical to these served as a means of control.The
carnosine and anserine content was ascertained in the 3-chlorine-
acetric-acid extraction by means of the distribution chromatogra-
phic method on paper.The deaffarentiation of the muscles leads to
a slight (18%) decrease of the carnosine content.Anserine content
is apparently dependent on still smaller fluctuations.In the case
of a deefferentiation, the carnosine content decreases about a
fortnight after the operation until it disappears entirely after
36 days. In spite of this no histidene is found in muscles.Oppo-
sing results are found for the anserine content on the occasion of
deefferentiation.After a fortnight it increases and remains increa-
sed until the 60th day. From the contrast of the results of the au-
thors with the data from publications it becomes obvious that the
fluctuations of carnosine and anserine content after a muscle-de-
nervation depend practically only on the elimination of motorio fi-
bres. Thsu the disjunction of the rear roots of the spinal marrow
together with the removal of the spinal marrow ganglia in the ca-
se of cats leads to an unessential decrease of the carnosine con-
tent; anserine content practically remains unchanged.The disjunc-
tion of the front roots ofthe spinal marrow causes a decrease and
later even thedisappearance of carnosine content.Anserine content
increases andremains increased until the 60th day after the opera-
Card 2/3   tion.

TITLE: Preparation of molding material with novolak resin. Class 39, No. 178978

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 4, 1966, 68

TOPIC TAGS: molding material, novolak resin

ABSTRACT: An Author Certificate has been issued describing a method using dry rolling
for making a molding material from novolak resin and a nitrogen-containing organic
compound. To extend the variety of molding materials with high dielectric properties
anhydroformaldehyde aniline is suggested as the oxygen-containing organic compound.

cetin (IV), and pennicillin (V). In relation
to the last two bacteria I, III, IV were much
more active, and in relation to the faecal alkali-
former-III. Enterococci showed sensitivity to
V, I, and III. Passage on the media with growing
content of antibiotics helped the development of
a resistance in the microbes to the preparations
studied. The microbes were most easily adapted
to streptomycin. The intestinal bacilli, the
faecal alkali-formers and partially the "Morgan"
bacilli adapted more quickly than the others.
In the highly resistant variants polymorphism of
the cell elements and weak biochemical activity
in comparison with the original cultures were
noted. A comparison of the adaptive pathogenic

AUTHORS: Popov, V. I., Sal'nikov, O. A., Sluchevskaya, V. M.

TITLE: Scattered neutron spectra in the case of initial energies of
               3 Mev

SOURCE: Yadernyye reaktsii pri malykh i srednikh energiyakh; trudy
               Vtoroy Vsesoyuznoy konferentsii, iyul' 1960 g. Ed. by
               A. S. Davydov and others. Moscow, Izd-vo AN SSSR, 1962, 256-260

TEXT: The energy spectra of 3-Mev neutrons inelastically scattered from
several metals used in reactor construction were measured in order to obtain
information on the behavior of neutrons in core and shield. The measure-
ments were made in annular geometry in the case of 60° scattering. An H_2+Ar

filled ionization chamber served as detector; this and the experimental
arrangement is described in Atomnaya energiya 3, 498, 1957. A deuteron-
bombarded heavy-ice target served as neutron source; the pulses from the
chamber were analyzed by means of a 128-channel pulse-height analyzer.
Besides the spectra of neutrons scattered through 60° from Na, Si, Pb and
Bi also the source spectrum was measured in the direction of the deuteron

Card 1/2

Scattered neutron spectra in the...

S/903/62/000/000/022/044
B102/B234

beam. The nuclear levels excited and the mean scattering cross sections were determined from the energy distributions measured (cf. Table). For Na in the range $2.45 \leq E_n \leq 4.00$ Mev also the excitation curve was constructed, under the assumption that inelastic scattering in this range is isotropic within error limits; σ_{in} drops linearly with increasing E_n. There are 5 figures and 1 table.

PHASE I BOOK EXPLOITATION   SOV/6241

Sluchevskiy, Boris Fedorovich

Radiolokatsiya i yeye primeneniye (Radar and Its Application). Moscow,
    Voyenizdat, 1962. 258 p.

Ed.: I. I. Matlin; Tech. Ed.: Ye. K. Konovalova.

PURPOSE: This book is intended for officers of the armed forces having the
    general radio engineering background provided by the curriculum of mili-
    tary schools. It may also be useful for the general reader wanting to
    acquaint himself with the physical foundations of radar, its design and
    combat employment.

COVERAGE: Chapter I of the book deals with the physical foundations of radar,
    the interaction of basic units in pulse radar systems, the determination of
    the target position, automatic tracking systems and with tactical as well
    as technical characteristics of radar stations. Chapters II and III, based
    on non-Soviet sources, give the tactical and technical characteristics and the

Card 1/5

Radar and Its Application   SOV/6241

combat employment of ground radar systems. In addition, the general char-
acteristics of modern aircraft and shipboard radar equipment and identifi-
cation systems are listed. Chapter III deals with radar countermeasures
as well as with methods and means of noise elimination in radar stations.
According to the author, due to the rapid progress of radar technique and
of electronics as a whole, the concept of artillery has been revised com-
pletely and a new, modern, very accurate system of rocket firing control
has been developed. In connection with this, a new problem of quantita-
tive and qualitative reorganization of certain arms and their role in
modern warfare is of immediate importance. No personalities are mentioned.
There are 51 references: 36 Soviet (including 7 translations) and 15
English.
